IBM 1440/1401 to System/360 Model 20: Transition Without Reprogramming

Now you can move smoothly into System/360 without reprogramming. And without having to take on more computer power than you feel you need.

IBM's System/360 Model 20 Submodel 5 with the new emulator feature makes the transition to System/360 easy for you. The emulator lets you run your existing 1440/1401 programs just as they are—*without change.*

At the same time, you can begin writing new programs in powerful computer languages such as Report Program Generator (RPG) and PL/I. If you wish, of course, you can continue to write in such familiar programming languages as Symbolic Programming System, Auto-coder, COBOL and FORTRAN.

Throughout the changeover to full System/360 computing, you move at whatever pace suits you. And when you have all of your programs converted for System/360 operation, you'll have all the facilities of the Model 20 Operating Systems going for you—including greatly increased power.

Ask your IBM representative to give you further details. He'll be glad to show you how easy your entry into the world of System/360 data processing can be.
